                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents in-chain hydroxylase CYP81B1 of Jerusalem artichoke. CYP81B1 is a microsomal cytochrome P450 that C catalyses the omega-2, omega-3 and omega-4 hydroxylation of capric, clauric and myristic acids. The major metabolite is the comega-3 hydroxylated compound. The invention provides isolated nucleic acids (see x58400-06) encoding plant fatty acid nucleic acids (see x58400-06). Also claimed are host cells, transgenic plants and compositions consisting of the plant fatty acid dydroxylase, a process for isolating additional fatty acid hydroxylase genes from a plant, and a process of altering the fatty acid composition in a plant by expressing the plant fatty acid composition in a plant by expressing the plant fatty acid hydroxylase in a transgenic plant, and hydroxylating or epoxidating the fatty acid composition in the plant. Manipulating the hydroxylated attack by insects and other poets. The transgenic plants may also be used as sources of hydroxylated and epoxidized fatty acids useful in the manufacture of e.g. lubricants, anti-slip agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

antigen region of the full length MAGE sequences. These peptides were used to design the nonapeptides of the invention (see R9937-R99342), which bind to a HLA molecule on a cell, and provoke lysis by cytolytic T cells (CTLs) specific for a complex of the HLA molecule and nonapeptide. The nonapeptides can be used diagnostically to identify tumours expressing a particular HLA molecule, or to identify cancer cells. The peptides can also be used therapeutically to induce a CTL response to tumours (where the peptides are optionally coupled to tumour-specific antibodies), or to induce a response by CTLs that are otherwise inactive. The peptide sequences may also be used to expand specific CTLs in vitro for later return to the patient, such as for treating melanoma. Tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HIA binding peptide; cell lysis; cytolytic T cell; MAGE family; human; tumour rejection antigen precursor; TRA; MAGE-1; tumour; cancer cell; antibody; melanoma; universal effector cell; vaccine; breast cancer; CTL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R99345 standard; Protein; 9 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         involving HLA-Al subtype cancerous cells. The nucleic acid encoding the nonapeptide can be used as a probe to identify tumour cells. This sequence is homologous to the peptide described and is encoded by the MAGE-21 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     An isolated nonapeptide having the amino acid sequence Glu-Val-Asp-pro-Tle-Gly-His-Leu-Tyr is derived from the tumour rejection antigen precursor encoded by the MAGE-3 gene and presented by HLA-AL. The nonapeptide can be used in a vaccine to treat a cancerous condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-FEB-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-AUG-1996

CC v45390 to y48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CC having as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-2.1, Al, Al. 2 or All. 1 or HLA-B or C) and induce a cytotoxic T cell Cresponse against the antigen from which the peptide is derived. CC control I lymphocytes (CTLS) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC or prevent viral important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in CC cancer, or used to treat chronic or acute conditions. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The non-human transformed cells, when polytransformed, are universal effector cells, and can be used in vaccines, or for treating melanoma or breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and

                                                          This peptide is a tumour rejection antigen presented by a HLA-B44 comblecule and derived from a MAGE-12 tumour rejection antigen (WE3038-43). Consider tumour rejection antigens (WE3038-43). Consider the bind to HLA-B44 positive cells, making them useful in identifying cells which present HLA-B44 molecules on their surfaces for use in the diagnosis and therapy of cellular abnormalities. The complex of the tumour rejection antigen and HLA comblecule provokes a cytolytic T cell response. The tumour rejection antigens, or complexes of tumour rejection antigens and that HLA-B44, can be used as vaccines to treat disorders characterised by expression of the TRAP molecule such as cancer, especially melanoma. Vaccines can also be prepared from cells which present the tumour rejection antigen/HLA complexes on their surface, such considered the province of the tumour cells which present the tumour rejection antigen/HLA complexes on their surface, such considered the province of the tumour cells which present considered the tumour rejection can also be prepared from cells which present the tumour rejection can also be prepared from their surface, such considered the province can also be prepared from cells which present the tumour rejection can also be prepared from cells which present the tumour rejection can also be prepared from cells which present considered the tumour rejection can also be prepared from cells which present considered the tumour rejection antigen/HLA complexes on their surface, such considered the cons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                       as non-proliferative transfectants.

                                                                                                    cc v45390 to v488214 represent specifically claimed immunogenic peptides cc having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HHA) binding motif. The immunogenic ce peptides can bind to a specific HLA allele (1.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell cresponse against the antigen from which the peptide is derived.

CC cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are commally induced by an antigen in the form of a peptide fragment bound cc are particularly important in tumour rejection and in fighting viral care particularly important in tumour rejection and in fighting viral confections. The peptides are therefore useful therapeutically to treat cor prevent viral infections and cancers in mammals (especially humans) cc. e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in conditions as susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                           are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful thorapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cance prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                             Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MIC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and to a HLA molecule, rather than the intact foreign antigen itself, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-DEC-1999

TRESTANCE OF THE PROPERTY OF T
                                                  CC Y45390 to Y48214 represent specifically claimed immunogenic peptides CC CC having a human major histocompatibility complex (MHC) Class I (also CK nown as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CF HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell cresponse against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly improvant in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat correct or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC Individuals susceptible or otherwise at risk of viral infection or Cancer, or used to treat chronic or acute conditions. They are also cuseful diagnostically, and can be used to induce a cytotoxic T cell cresponse, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The cc produce corrections and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Lo

                                         CC v45390 to v48214 represent specifically claimed immunogenic peptides
CC having a human major histocompatibility complex (MEC) Class I (also
CC known as human leukocyte antigen (HLA)) binding motif. The immunogenic
CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes
CC HLA-A2.1, Al, Al. 2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell
CC response against the antigen from which the peptide is derived.
CC Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are
CC consmally induced by an antigen in the form of a peptide fragment bound
CC or praticularly important in tumour rejection and in fighting viral
CC infections. The peptides are therefore useful therapeutically to treat
CC or prevent viral infections and canners in mammals (especially humans)
CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma.
CC They can be administered as vaccines to elicit an immune response in
CC cancer, or used to treat chronic or acute conditions. They are also
CC useful diagnostically, and can be used to induce a cytotoxic T cell
CC response, by contacting a cytotoxic T cell with the peptide e.g. to
CC produce CTLs ex vivo for infusion back into a patient. The
CC polymucleotides encoding the immunogenic peptides are also useful
CC therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ş
                                                                                                 cc v45390 to v488214 represent specifically claimed immunogenic peptides cc having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HHA) binding motif. The immunogenic peptides can bind to a specific HLA allele (1.e. HLA has subtypes CC HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell CC response against the antigen from which the peptide is derived. CC cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are CC or all molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC Individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also CC useful diagnostically, and can be used to induce a cytotoxic T cell cresponse, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ax vivo for infusion back into a patient. The CC therapeutically and for immunogenic peptides are also useful

                                      CC having a human major histocompatibility complex (MHC) Class I (also companies and human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell cresponse against the antigen from which the peptide is derived. CC cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are commally induced by an antigen in the form of a peptide fragment bound commally induced by an antigen in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation in the form of a peptide fragment bound comparation and in fighting viral comparations. The peptides are therefore useful therapeutically humans) comparation in the form of a period carcinoma. They can be administered as vaccines to elicit an immune response in conditions. They are also concer, or used to treat chronic or acute conditions. They are also concer, or used to treat chronic or acute conditions. They are also concer, by contacting a cytotoxic T cell with the peptide e.g. to concer, or contacting a cytotoxic T cell with the peptide e.g. to concer, or influsion back into a patient. The concernation in the immungenic peptides are also useful concernation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-DEC-1999

                                                                                                                                                                                                                                                                      CC vat5390 to v48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell C response against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat Co or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C. AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in CC individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also cuseful diagnostically, and can be used to induce a cytotoxic T cell C response, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ex vivo for infusion back into a patient. The CC therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma; vaccine; immunisation.

                                                                                                                  CC raysho to Y48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CK nown as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-a subtypes CHA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell CC response against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat C or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in claim individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also CC response, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ex vivo for infusion back into a patient. The CC therapeutically and for immunisation as above.

                                                                                                                                                                                                                                                                                                                        B08827-37 represent melanoma associated antigen (MAGE)-3 derived immunogenic peptides. The peptides are capable of binding to major histocompatibility complex (MHC) class II molecules. Stimulation with the peptides induces proliferation of CD4+ T cells, and of their cytolytic activity. CD4+ T cells exposed to the peptides were able to cause lysis of melanoma cells expression MAGE-3 and HLA-DR molecules. The peptides are useful for inducing an immune response against tumour cells expressing a MAGE-3 antigen. They are also useful for the preparation of anti-tumour medicament for use as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Melanoma associated antigen-3; MAGE-3; immunogenic peptide; major histocompatibility complex; MHC; class II molecule; tumour; CD4+ T cell proliferation; melanoma cell; immune response; vaccine

                                                                                                                                                                                                              CC diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia CC diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia CC gravis), allograft rejection, allergies, lyme disease, hepatitis, CC post-streptococcal endocarditis or glomerulonephritis and food post-streptococcal endocarditis or glomerulonephritis and food composes against other immunogens administered with the peptides. CC hypersensitivities. The peptide epitopes can be used to enhance immune cresponses spainst other immunogens administered with the peptides. CC plaeases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical coarcinoma, lymphoma, and condyloma acuminatum. The peptides may also be used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be useful as diagnostic or treatment regimen. Also, the peptides may be used to predict which individuals will be at substantial risk of developing chronic infection. The selection of appropriate T and B cell epitopes should allow the cavelopment of epitope based vaccines particularly towards conserved correlations of pathogens which are characterized by high sequence

The peptide/analogue binds to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical can be used to induce a than or equal to 1,000 nM. The pharmaceutical can be used to induce a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   glomerulonephritis; food hypersensitivity; malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 than or equal to 1,000 nM. The pharmaceutical can be used to induce a helper T cell response. The pharmaceutical focuses the immune response towards selected determinants and could therefore be used in cases of chronic viral diseases and cancer. Examples of diseases that can be

X-RAY CRYSTALLOGRAPHY (2.0 ANGSTROMS) OF 35-210.

MEDLINE-99036858; PubMed-9817840;

Ultsch M., Lokker N.A., Godowski P.J., de Vos A.M.;

"Crystal structure of the NK1 fragment of human hepatoc;
factor at 2.0-A resolution.";

Structure 6:1383-1393(1998):

-!- FUNCTION: HGF IS A POTENT MITOGEN FOR MATURE PARENC!

HEPATOCYTE CELLS, SEEMS TO BE AN HEPATOTROPHIC FACTO
AS GROWTH FACTOR FOR A BROAD SPECTRUM OF TISSUES ANITH HAS NO DETECTABLE PROTEASE ACTIVITY.

-!- SUBUNIT: DIMER OF AN ALPHA CHAIN AND A BETA CHAIN L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         [9]

Plant Physiol. CHANNEL PROTEIN IN TONOPLAST. THESE PROTEINS MAY ALITHE DIFFUSION OF AMINO ACIDS AND/OR PEPTIDES FROM THE TONOPLAY.
INTERIOR TO THE CYTOPLASM.
-I- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-I- TISSUE SPECIFICITY: FOUND IN ALL SEED TISSUES THAT ARE ALIVE SEED MATURITY, BUT NOT IN TISSUES THAT LOSE VIABILITY DURING SEED MATURITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TIPA_PHAVU STANDARD; PRT; 256 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: THIS PROTEIN IS A COMPONENT OF THE HETEROGENOUS NUCLEAR RIBONUCLEOPROTEIN (HRNNP) COMPLEXES WHICH PROVIDE THE SUBSTRATE FOR THE PROCESSING EVENTS THAT PRE-MRNAS UNDERGO BEFORE BECOMING FUNCTIONAL, TRANSLATABLE MRNAS IN THE CYTOPLASM. BINDS POLY (RG). SUBCELLULAR LOCATION: NUCLEAR; NUCLEOPLASM.
TISSUE SPECIFICITY: EXPRESSED UBIQUITOUSLY.
TISSUE SPECIFICITY: EXPRESSED UBIQUITOUSLY.
DOMAIN: EACH QUASI-RRM REPEAT BOUND POLY(RG), WHILE ONLY THE N-TERMINAL QRAM BOUND POLY(RC) AND POLY (RQ). NONE OF THE REPEATS BOUND DETECTABLE AMOUNTS OF POLY (RA).
SIMILARITY: CONTAINS 3 RNA RECOGNITION MOTIFS (RRM).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | : | | | | |
